

This map illustrates the study area for first-mile and last-mile connectivity along the Pune Metro Aqua Line, specifically covering the stretch from Vanaz to Garware College. The map highlights a 500-meter buffer around each metro station and multiple buffer zones around the metro alignment at 500 meters, 1 kilometer, and 2 kilometers. These buffers help identify accessibility patterns, coverage areas, and connectivity gaps within the influence zone of the metro corridor. 02/12/2025

This map illustrates India's comprehensive road network, comprising National Highways, State Highways, and rural roads that collectively form the backbone of the country's mobility system. As one of the largest road networks globally, it facilitates major passenger and freight movement while supporting economic and regional connectivity. The data used in this map is derived from OpenStreetMap (OSM) and official Government of India sources, including MoRTH and the QGD Platform.

03/12/2025

This map uses polygon data to represent the spatial extent of major slum settlements across Mumbai, where an estimated 5.2 million people reside in informal housing. Key areas such as Dharavi (2.39 sq km), Malvani, Worli-BDD Chawls, Kurla, Antop Hill, and Baiganwadi illustrate the city's high-density living patterns. Although the total slum-covered area has declined from 47.7 sq km in 2005 to 43.6 sq km in 2022, significant variations exist across different neighborhoods. Mapping these polygons helps highlight gaps in housing, accessibility, and urban services—reinforcing the need to design cities that prioritize people, walkability, and inclusive infrastructure. 04/12/2025
